

# Beetle Squad

Improving Robustness and Efficiency for  
Flock Control of Nonholonomic Agents

Maxime Bernard<sup>1</sup> and Jonatan Uziel Alvarez-Munoz<sup>1</sup>

# Additional features

## Obstacles and peers avoidance

Inspired from flocking's repulsion force.

## Kalman Filter

Smoothing of position and speed measurements.

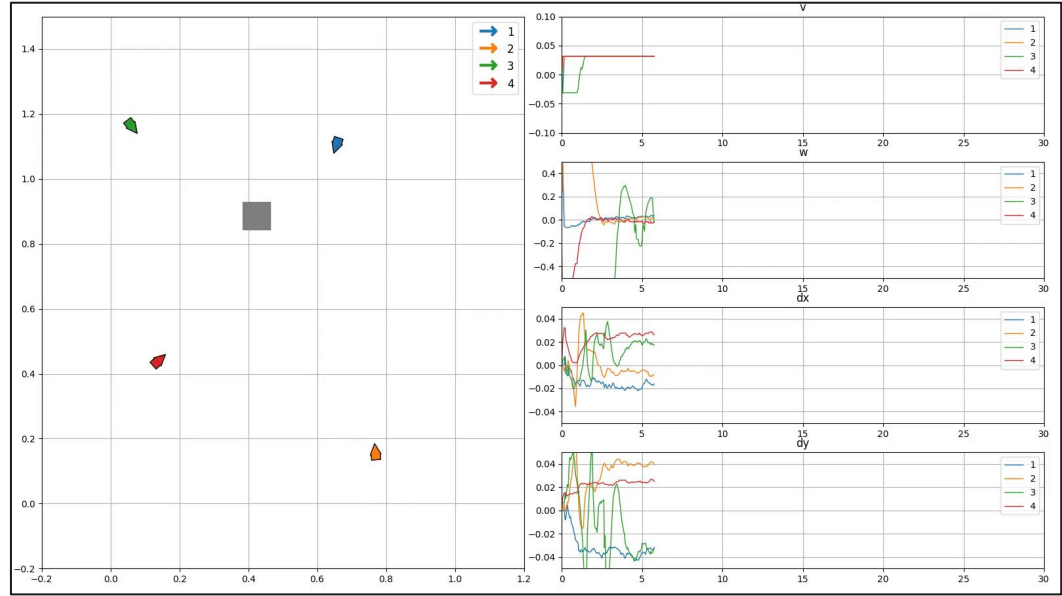

# Experimental platform

## Position tracking

ArUco markers, Raspberry Pi and ROS package.

## Python animation

Position, control force and linear speed animation using ROS bags' data.

# Event Based control

Postulate: No need to send **position** and **speed** data if it is **constant**.

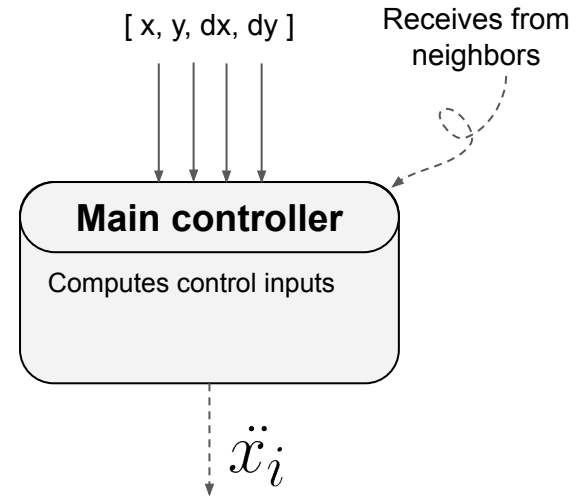

→ Detects variation on the observed data: this is an **event**.

→ Triggers communication to peers on event detection.

# Event Based control

$$\ddot{x}_i = A.err(\underline{x}_i) + B.err(\underline{\dot{x}}_i)$$
